ADMINISTRATOR
Fritz E. Wolf

January 1, 1975

FOREWORD

This airport directory has been prepared and is distributed by the Division of Aeronautics for the purpose of making your flights in Wisconsin safer and more enjoyable.

Compiled from information submitted by airport owners, every effort has been made to provide a complete and accurate directory. As a result of constantly changing airport conditions, the Division assumes no responsibility for any action taken by a pilot on the basis of information contained herein.

Pilots are reminded it is their responsibility to check FAA Notices to Airmen and the Airman's Information Manual for current information, as well as making a visual inspection of the airport before using.

Suggestions with respect to corrections, additions or deletions of any of the data contained in the directory will be welcomed by the Division of Aeronautics.

Copies are available at \$1.40 a copy by writing:

AIR NAVIGATION AIDS

108.1-111.9 MHz: ILS localizer with or without simultaneous radio-telephone channel operating on odd-tenth decimal frequencies (108.1, 108.3, etc.)

108.0-117.95 VHF omnidirectional range (VOR)

112.0-117.9 MHz: Airway Track Guidance (VOR)

COMMUNICATIONS

118.0-121.4 MHz: Air Traffic Control Communications

121.5 MHz: Emergency (World-Wide)

121.6-121.9 MHz: Airport Utility (Ground Control)

121.95 MHz: Flight Test

Civil communications frequencies used in the FSS air/ground system are now operated simplex on 122.0, 122.2, 122.3, 122.4, 122.6, 122.7, 123.6; emergency 121.5; plus receive-only on 122.05, 122.1, 122.15, and 123.6.

- a. 122.0 is assigned to selected FSSs as a weather channel for both general aviation and air carrier.
- b. 122.2 is assigned to all FSSs as a common en route simplex service.
- c. 123.6 is assigned as the airport advisory channel at non-tower FSS locations; however, it is still in commission at some FSSs collocated with towers to provide part-time Airport Advisory Service.
- d. 122.1 is the primary receive-only frequency at VORs. 122.05, 122.15 and 123.6 are assigned at selected VORs meeting certain criteria.
- e. Some FSSs are assigned 50KHz channels for simplex operation in the 122-123 MHz band (e.g. 122.35).

122.8, 123.0, 122.85, 122.95 MHz: Aeronautical Advisory Stations (UNICOM)

122.9 MHz: Aeronautical Multicom Stations

123.1 MHz: Search and Rescue (SAR) Scene of Action

123.05 MHz: Aeronautical Advisory Stations (UNICOM) Heliports

123.15-123.55 MHz: Flight Test

123.3, 123.5 MHz: Flying School

123.6 MHz: FSS's, Airport Advisory Service

128.85-132.0 MHz: Aeronautical En Route Stations (Air Carrier)

132.05-135.95 MHz: Air Traffic Control Communications

For Current Information See AIM.

TRAFFIC ADVISORY PRACTICES AT NONTOWER AIRPORTS

There is no substitute for alertness while in the vicinity of an airport. An airport may have a flight service station, UNICOM operator, or no facility at all. Pilots should predetermine what, if any, service is available at a particular airport. Combining an aural/visual alertness and complying with the following recommended practices will enhance safety of flight into and out of uncontrolled airports.

1. Recommended Traffic Advisory Practices - As standard operating practice, all inbound traffic should continuously monitor the appropriate field facility frequency from 15 miles to landing. Departure aircraft should monitor the appropriate frequency either prior to or when ready to taxi.

INBOUND AIRCRAFT			OUTBOUND AIRCRAFT	
Airport	Frequency	Broadcast Position, Altitude, Intentions	Broadcast Position	Broadcast Position and Intentions
Part-Time Tower (when closed)	Tower Local Control	5 Miles	Downwind Base, Final	When ready to taxi; and before taking runway for takeoff.
Part-Time Tower (closed) but Full-Time FSS	Tower Local Control	*15 Miles	*5 Miles	*When ready to taxi; and before taking runway for takeoff.
Part-Time FSS (closed)	123.6	5 Miles	Downwind, Base, Final	When ready to taxi; and before taking runway for takeoff.
Full-Time or Part-Time FSS (open)	123.6	*15 Miles	*5 Miles	*When ready to taxi; and before taking runway for takeoff.
UNICOM	122.8	*5 Miles		*When ready to taxi; and before taking runway for takeoff.
UNICOM (if unable to establish contact)	122.8	5 Miles	Downwind, Base, Final.	When ready to taxi; and before taking runway for takeoff.
No Facility on airport	122.9	5 Miles	Downwind, Base, Final	When ready to taxi; and before taking runway for takeoff.

*Contact appropriate facility first; e.g., "EAU CLAIRE Radio, this is Cessna 12345. Over," before announcing arrival/departure intentions. Except for scheduled air carriers and other civil operators having authorized company call signs, departure aircraft should state the aircraft type, identification number, type of flight planned, i.e., VFR or IFR, and the planned destination.

NOTE--FSS at part-time non-FAA tower locations do not have tower local control frequency. Use 123.6.

EMERGENCY PROCEDURES GENERAL

1. A pilot in any emergency phase (uncertainty, alert, or distress should do three things to obtain assistance:

a. If equipped with a radar beacon transponder (civil) or IFF/SIF (military), and if unable to establish voice communications with an air traffic control facility, switch to Mode A/3 and Code 7700. Military transponder should also be placed in the Emergency position. If crash is imminent and equipped with a Locator Beacon, actuate the emergency signal.

b. Contact controlling agency and give nature of distress and pilot's intentions. If unable to contract controlling agencies, attempt to contact any agency on assigned frequency. 121.5 MHz (transmit and receive).

Transmit as much of the following as possible:

(1) MAYDAY, MAYDAY, MAYDAY (if distress), or PAN, PAN, PAN (if uncertainty or alert). If CW transmission, use SOS (distress or XXX (uncertainty or alert).

(2) Aircraft identification repeated three times.

(3) Type of aircraft.

(4) Position or estimated position (stating which).

(5) Heading (true or magnetic) (stating which).

(6) True airspeed or estimated true airspeed (stating which).

(7) Altitude.

(8) Fuel remaining in hours and minutes.

(9) Nature of distress.

(10) Pilot's intentions (bailout, ditch, crash landing, etc.).

(11) Assistance desired (fix, steer, bearing, escort, etc.).

(12) Two 10-second dashes with mike button (voice) or key (CW) followed by aircraft identification (once) and OVER (voice) or K (CW).

NOTE--ARTCC emergency frequency capability normally does not extend to radar coverage limits. If the ARTCC does not respond to transmission on emergency frequency 121.5 MHz or 243.0 MHz, pilots should initiate a call to the nearest Flight Service Station or Airport Traffic Control Tower.

c. Comply with information and clearance received. Accept the communications control offered to you by the ground radio station, silence interfering radio stations, and do not shift frequency or shift to another ground station unless absolutely necessary.

For Current Information, See AIM.

2. Pilots of IFR flights experiencing two-way radio failure are expected to adhere to the procedures prescribed under "RADIO COMMUNICATIONS FAILURE" (FAR Part 91.127). However, if a pilot should become lost, or if an emergency or other factors prevent the pilot from being able to comply with prescribed procedures, such pilot, as well as pilots of VFR flight with an emergency and a radio failure, may attempt to alert civil or military radar systems as follows:

a. If receiver only is operating: Fly triangular pattern to the RIGHT (see diagram). Hold each heading for two minutes (1 minute for jet use). Complete a minimum of two such patterns before resuming original course and then repeat pattern at 20-minute intervals. When flying triangular patterns to the right, the emergency frequencies (121.5 or 243.0 MP), should be guarded. If pattern is observed by radar controllers, instructions will be given.

b. If transmitter and receiver are both inoperative: Fly a triangular pattern to the LEFT (see diagram), in the same manner as described above. If patterns are observed by radar controllers, an escort will be dispatched, if possible. If distressed aircraft is flying in IFR conditions or if at night, landing lights, navigational lights, etc., should be turned on to aid the interceptor. If intercepted, follow rescue aircraft.

Figure 1 - WITH RECEIVER OPERATING ONLY

Figure 2 - WITH TRANSMITTER AND RADIO INOPERATIVE

c. The Pilot should remember that he has three means of declaring an emergency:

- (1) Emergency SQUAWK from transponders
- (2) Sending emergency message
- (3) Flying triangular pattern

- d. Some ground stations have four electronic means of assisting:
- (1) Receipt of emergency message
 - (2) Radar detection of triangular pattern
 - (3) DF bearings: and
 - (4) Detection of transponder emergency SQUAWK.

- e. Pilots should remember the FOUR C's

- (1) Confess your predicament to any ground radio station. Do not wait too long. Give SAR a chance!
- (2) Communicate with your ground link and pass as much of the distress message on first transmission as possible. We need information for best SAR action!
- (3) Climb if possible for better radar and DF detection. If flying at low altitude, the chance for establishing radio contact is improved by climbing, also chances of alerting radar systems are sometimes improved by climbing or descending.

NOTE--Unauthorized climb or descent under IFR conditions within controlled airspace is not permitted except in emergency. Any variation in altitude, in connection with flying radar patterns will be unknown to Air Traffic Control except at radar locations having height finding capabilities. Air Traffic Control will operate on the assumption that the provisions of FAR 91.127 are being followed by the pilot.

For current information, see AIM.

- (4) Comply-especially Comply-with advice and instructions received, if you really want help. Assist the ground "communications control" station to control communications on the distress frequency on which you are working (as that is the distress frequency for your case). Tell interfering stations to maintain silence until you call. Cooperate!

3. For bailout, set radio for continuous emission. For ditching or crash landing, radio should, if it is considered that there is no additional risk of fire and if circumstances permit, be set for continuous transmission.

4. When a pilot is in doubt of his position, or feels apprehensive for his safety, he should not hesitate to request assistance. Search and Rescue facilities, including Radar, Radio and DF stations, are ready and willing to help. There is no penalty for using them. Delay has caused accidents and cost lives. Safety is not a luxury. Take Action!

For Current Information, See AIM.

RULES PERTAINING TO AIRCRAFT ACCIDENTS, INCIDENTS, OVERDUE AIRCRAFT, AND SAFETY INVESTIGATIONS

(National Transportation Safety Board, Procedural Regulation, Part 430 (in part)).

1. IMMEDIATE NOTIFICATION

The operator of an aircraft shall immediately, and by the most expeditious means available, notify the nearest National Transportation Safety Board, Bureau of Aviation Safety Field Office when:

a. An aircraft accident or any of the following listed incidents occur:

1. Flight control system malfunction or failure;
2. Inability of an required flight crew member to perform his normal flight duties as a result of injury or illness;
3. Turbine engine rotor failures excluding compressor blades and turbine buckets;
4. In-flight fire;
5. Aircraft collide in flight.

b. An aircraft is overdue and is believed to have been involved in an accident.

c. The following information is required if available:

1. Location;
2. Date;
3. Time;
4. Aircraft make, model, and registration number and nationality;
5. Names of operator and crew;
6. Number of persons involved;
7. Injuries of each person;
8. Weather conditions.

2. MANNER OF NOTIFICATION

The most expeditious method of notification to the National Transportation Safety Board by the operator will be determined by the circumstances existing at that time. The National Transportation Safety Board has advised that any of the following would be considered examples of the type of notification that would be acceptable:

- a. Direct telephone notification.
- b. Telegraphic notification.

c. Notification to the Federal Aviation Administration who would in turn notify the NTSB by direct communication; i.e., dispatch or telephone.

3. REPORTS

a. The operator shall file a report on NTSB for 6120.1 or 6120.2 available from the National Transportation Safety Board Field Offices, or the National Transportation Safety Board, Washington, D.C.:

1. Within ten (10) days after an occurrence for which notification is required in 1 (a) and (b) above;

2. When, after seven (7) days, an overdue aircraft is still missing.

3. Upon request of an authorized representative of the National Transportation Safety Board:

b. Each crew member, if physically able at the time the report is submitted, shall attach thereto a statement setting forth the facts, conditions and circumstances relating to the accident or occurrence as they appear to him to the best of his knowledge and belief. If the crew member is incapacitated, he shall submit the statement as soon as he is physically able.

4. WHERE TO FILE THE REPORTS

a. The operator of an aircraft shall file with the Field Office of the National Transportation Board nearest the accident or incident any report required by this section.

b. The National Transportation Safety Board field offices are listed under U.S. Government in the telephone directories in the following cities: Anchorage, Alaska; Chicago, Ill.; Denver, Colo.; Fort Worth, Texas; Kansas City, Mo.; Los Angeles, Calif.; Miami, Fla.; New York, N.Y.; Oakland, Calif.; Seattle, Wash.; Washington, D.C.

ZULU TIME - Central Daylight Time plus 5 hours

CEILING AND VISIBILITY MINIMUMS VFR FLIGHT

VISIBILITY	DISTANCE FROM CLOUDS	
CONTROL ZONE 3 Miles (1)	500 feet under (1) 1,000 feet over (1) 2,000 feet horizontally (1) and 1,000-foot ceiling	
CONTROL AREA 3 Miles AND TRANSITION AREA	500 feet under 1,000 feet over 2,000 feet horizontally	
CONTINENTAL 5 Miles CONTROL AREA AND ABOVE 10,000. MSL	1,000 feet under 1,000 feet over 1 mile horizontally	
OUTSIDE 1 Mile (2) CONTROLLED AIRSPACE	1200 feet or BELOW	ABOVE 1200 feet
	clear of clouds	500 feet under 1,000 feet over 2,000 feet horizontally

(1) If traffic conditions permit, air traffic control will issue an air traffic clearance for flight within a control zone when the weather conditions are less than specified. However, no person shall operate an aircraft VFR, other than a helicopter, irrespective of any clearance, unless the visibility is one mile. All flights shall remain clear of clouds.

(2) Helicopters are excepted from the one mile requirement when operated at or below 1200 feet and at reduced air-speed.

FLIGHT PLAN SEQUENCE

- | | |
|--------------------------------------|---------------------------|
| 1 Type (IFR-VFR) | 10 Remarks |
| 2 Aircraft Ident. No. | 11 Estimated Time Enroute |
| 3 Aircraft Type/Special Equipment | 12 Fuel on Board (Hrs.) |
| 4 Estimated True Airspeed - Kts. | 13 (IFR Flt. Only) Alt. |
| 5 Point of Departure | 14 Pilot's Name |
| 6 Departure Time (Zulu) Act, or Est. | 15 Pilot's Address |
| 7 Initial Cruising Altitude | 16 No. of Persons Aboard |
| 8 Route of Flight | 17 Color of Aircraft |
| 9 Destination | |

VISUAL APPROACH SLOPE INDICATOR (VASI)

When on the proper glide path, the pilot will overshoot the downwind bars and undershoot the upwind bars. Thus he will see the downwind bars as white and the upwind bars as red. From a position below the glide path, the pilot will see the light bars as red and from above the glide path, the light bars will appear white. Passing through the path from a low position is indicated to the pilot by a transition in color from red through pink to white. From a high position, passing through the path is indicated to the pilot by a transition in color from white through pink to red. When the pilot is below the glide path, the red bars tend to merge into one distinct red signal. A safe obstruction clearance may not exist when this distinct red signal is visible. The visual glide path will separate into individual lights as the pilot approaches the runway threshold. At this point, the approach should be continued by reference to the runway touchdown zone.

STANDARD FAA 2-BAR VASI

1. Below glide path	Red	Runway	Red
	Red		Red
2. On glide path	Red	Runway	Red
	White		White
3. Above glide path	White	Runway	White
	White		White
