GENERAL NOTES

Sketches and notes apply to any number of spans.

Number and type of girders and location of field splices to be determined by design.

For horizontal curves with a radius of less than 150 ft, the girders shall be fabricated along the curve, with the centerline being along the axis of the structure. For a radius greater than 1400 ft, the girders shall be fabricated along the axis of the structure. The girders shall be placed parallel to each other when possible.

For horizontal curves, the substructure units shall be placed parallel to each other when possible.

For kinked girder layout, the substructure units shall be placed along the radial lines when possible.

Sketched and notes may be modified for more severe curvatures.
